

REDCap Attribute	Column	Description
Variable Field/Name	A	The unique variable name for the field. This field must not be modified , because the variable name is used in subsequent branching/skip logic, data harmonization, and analysis.
Form Name	B	The title of the form/instrument in REDCap's data dictionary format.
Section Header	C	A visual separator used to chunk a long form into digestible pieces. It doesn't store data itself; it displays text to guide the user or participant through a change in topic.
Field Type	D	The format of the data collection field. Examples include numeric fields, text boxes, notes/paragraph fields, single-choice, multiple-choice, dropdowns, sliders, or file upload slots.
Field Label	E	The human-readable text, question, or instructional prompt displayed directly on the data entry form or survey. It tells the user or study participant exactly what information needs to be entered into that specific field. This is a survey question.
Choices, Calculations, OR Slider Labels	F	The parameters that define how a field behaves based on its type: - Choices: The raw coded values and labels for single- or multiple-choice fields. - Calculations: The mathematical formula inside a calculated field. - Slider Labels: The text displayed at the left, middle, and right phases of a visual slider bar.
Field Note	G	Displayed directly underneath the data entry box, providing quick instructions or reminders to the person entering data.
Text Validation Type OR Show Slider Number	H	Controls constraints and specific visual readouts: - Text Validation Type: Forces a text box to accept only specific formats. - Show Slider Number: A setting for slider fields that chooses whether or not to display the exact numerical value to the user while they drag the slider.
Text Validation Min	I	The lowest acceptable value allowed in a validated text field.
Text Validation Max	J	The highest acceptable value allowed in a validated text field.
Identifier?	K	If set to "Yes", tags it as containing Protected Health Information (PHI) or personally identifiable information.
Branching Logic	L	When applied to a field, the field stays hidden until specific conditions are met. Also called "skip logic" or "conditional logic." It controls the visibility of a field based on answers given to previous questions.
Required Field?	M	A setting that forces data entry. If set to "Yes", the form or survey cannot be blankly saved or submitted without completing this field first.
Custom Alignment	N	Controls the visual layout of the field on the data entry page or survey. Determines where the Field Label sits in relation to the Data Entry Box or response options.
Question Number (surveys only)	O	An optional field used exclusively when a form is enabled as a survey. It allows for the manual numbering of questions for the participant's view, overriding REDCap's automatic numbering if desired.
Matrix Group Name	P	The unique backend identifier used to link multiple questions together into a single grid or table view (known as a Matrix of Fields).
Matrix Ranking?	Q	A specialized setting used when multiple-choice questions are grouped together in a grid. Ensures that a user can only select a specific answer column once per grid, preventing them from giving two rows the same rank.
Field Annotation	R	A hidden, backend text area used by project builders to add notes, map variables to external data standards or apply "Action Tags" (like @HIDDEN or @DEFAULT) that alter how the field behaves dynamically. Not visible to data entry staff or survey participants.
